quality mounted bearings

MOLINE BEARING CO.

ACCESSIBLE RESPONSIVE FLEXIBLE KNOWLEDGEABLE QUALITY PROVEN HUMAN

WE WORK, EVERYDAY

WE ARE UP EARLY, WAKE THE KIDS, GRAB A CUP OF COFFEE AND HEAD OUT THE DOOR.

THE SUN RISING OVER FIELDS COVERED WITH MORNING DEW, GREETES US ALMOST DAILY AND EVERY DAY WE ARE REMINDED THAT THIS COUNTRY HAS BEEN GOOD TO US. AMERICA HAS REWARDED US WITH THE BUSINESS WE HAVE BUILT AND THE RELATIONSHIPS MADE ALONG THE WAY.

THIS LAND HAS GIFTED US OUR TRADE, A TRADE THAT HAS US STRIVING TO ALWAYS DO BETTER WHILE UNDERSTANDING THAT OUR HANDS CRAFT, BUILD AND SHIP QUALITY BEARINGS TO YOU.

FUNDAMENTALLY WE HAVE ONE JOB TO PERFORM; TO KEEP YOUR EQUIPMENT RUNNING SO THAT YOU CAN STAY IN OPERATION, PRODUCTIVE AND PROFITABLE.

CONSIDER THIS OUR OBLIGATION, TO SUPPLY THE MECHANICAL POWER INDUSTRY, QUALITY BEARINGS AND EXEMPLARY SERVICE.

THESE GOALS ARE WHAT GETS US UP, CRAFTING THE BEARINGS WE OFFER, EACH ONE..... DAILY.

DAVID FAUNTLEROY MOLINE BEARING CO.

TYPE E
TAPERED
ROLLER
BEARINGS

Moline Type E Tapered Roller Bearings offer many advantages including high-speed suitability, positive locking to the shaft, ruggedness, and low price.

The housings are as compact as possible without sacrificing their brawny ruggedness. Made in the USA of high quality Class 30 cast iron, they are precision machined to close tolerances.

On each end of the inner race there is a Drive Collar with two headless set screws. These screws extend through clearance holes in the inner race, locking it to the shaft.

Moline uses only genuine Timken® Tapered Roller Bearings. They are made from vacuum degassed steel which gives rollers and races added life, and provides superior load and speed characteristics. A long inner race insures load distribution over a considerable length of shaft. In addition, the arrangements of Timken rollers and races is such that Moline Type E Mounted Bearings will handle slight angular shaft misalignment. These bearings also have high radial and thrust load capacities, and are capable of handling most combinations of loads found in all normal applications.

Moline Type E Pillow Blocks, Flange Bearings, Piloted Flange Bearings, and Wide Slot Take-ups are ready to slip onto the shaft when received, because they are completely assembled, adjusted, sealed and pre-lubricated at the factory. There is no danger of bearing failure resulting from dirt or dust entering the bearing before or during installation.

Such contamination is very difficult to prevent in bearings that are not shaft ready. No time or expense is required for cleaning housings, for adjusting, or for initial lubrication. Therefore, overall installed cost is less in many instances. Operating expense over time is also generally less.

The V-Guard™ contact seal, which is built in at each end of the bearing during factory assembly, effectively seals against loss of lubricant and admission of dust and dirt, both on and off the shaft. Efficiency of the seal is consistent throughout the allowable range of self-alignment.

Bore tolerance is $+.001"/- .000"$ for 3" and smaller bores; $+.002"/- .000"$ for bores larger than 3".

Moline Mounted Type E bearings are available in shaft sizes from 1" to 7" and 25 to 180mm in Pillow Blocks, $1\frac{3}{16}"$ to $4\frac{1}{2}"$ and 35 to 115mm in 4-Bolt Flanges, $1\frac{1}{2}"$ to 5" and 40 to 125mm in Piloted Flanges, and $1\frac{3}{4}"$ to $3\frac{1}{2}"$ and 45 to 90mm in Wide Slot Take-ups.

All housings are available in our standard painted finish. Custom Colors, Powder Coating, Stainless Steel Powder coating, Nickel plating, Epoxy coatings and Teflon coatings will be quoted on request.

Moline Type E bearings are carried in warehouse and distributor stocks all over the United States and in Canada.

TYPE E

MOLINE TYPE E MOUNTED BEARINGS

TIMKEN® TIMKEN INSERT INSIDE

FEATURES OF MOLINE TYPE E TAPERED ROLLER BEARINGS

WITH TIMKEN® TAPERED ROLLER BEARINGS

- For applications that have high radial, thrust loads, or combination of both with minimal misalignment needs
- Dimensionally interchangeable with comparable Type E units, Moline Split E1000, Moline ME2000 and ME3000
- Suggested Industry Applications: Conveying, Screening, Cranes, Mining, Forestry, Oil, Gas, Power Generation, Aggregate
- Available in shaft sizes from 1" to 7", and 35mm to 180mm
- Assembled, adjusted and pre-lubricated in advance for immediate use
- All components are made, machined and assembled in the USA
- Built with Timken™ Enhanced DEE tapered roller bearings with the highest industry load ratings, double-extended inner race, case hardened rollers and races
- Extended inner race has two locking collars with 65° set screw spacing
- Misalignment = .010" per foot of shaft
- Close fit oversized collars act as flingers for additional protection in dusty or damp environments
- Standard V-Guard™ Nitrile and Teflon Contact Seal or Balanced Labyrinth Seal
- Timken™ Lithium Complex Grease operating temperature is up to 250°, High temperature grease is available up to 350°
- For custom lubrication, please see page 154 or contact the factory for more information
- Housings of Class 30 cast iron are made in Illinois, Iowa and Wisconsin
- Housings available in the standard painted finish. Powder coating in RAL or custom colors, Stainless Steel Powder coating, Nickel-plating, Epoxy, Teflon and other coatings are available. See page 150 or contact the factory for further information
- Custom machining and design service are available. See page 146 or contact the factory for further information
- Made in the United States

Standard V-Guard™ Contact Seal made of Nitrile, Teflon and Steel for extreme dirt and wet environments

Balanced Metal Labyrinth Seal for high speed and high temp applications

MOLINE BEARING CO.

TYPE E

MOLINE SPLIT E1000 MOUNTED BEARINGS

TIMKEN® TIMKEN INSERT INSIDE

FEATURES OF MOLINE SPLIT E1000 SPHERICAL ROLLER BEARINGS

TYPE E

- For applications that have heavy radial and thrust load needs and require misalignment capability
- Dimensionally interchangeable with comparable Split E units, Moline Type E, ME2000 and ME3000
- Suggested Industry Applications: Mining, Aggregate & Cement, Paper & Forestry, Air Handling, Baggage Handling, and Food Processing
- Available in shaft sizes from 1 3/16" to 5", and 35mm to 125mm
- Assembled, adjusted and pre-lubricated in advance for immediate use
- All components are made, machined and assembled in the USA
- Built with Timken™ Enhanced DEE tapered roller bearings with the highest industry load ratings, double-extended inner race, case hardened rollers and races
- Extended inner race has two locking collars with 65° set screw spacing
- +/-4° misalignment capacity
- Available in Expansion (red tag) and Non-Expansion (yellow tag) capabilities
- Replaceable solid cartridge assembly for easy maintenance
- Steel cartridge is Black Oxide coated for corrosion protection
- Standard V-Guard™ Contact Seal made of Nitrile, Teflon and Steel for extreme dirt and wet environments
- Timken™ Lithium Complex Grease operating temperature is up to 250°, High temperature grease is available up to 350°
- For custom lubrication, please see page 154 or contact the factory for more information
- Housings of high strength Class 65-45-12 Ductile Iron made in Illinois and Wisconsin
- Housings available in the standard painted finish. Powder coating in RAL or custom colors, Stainless Steel Powder coating, Nickel-plating, Epoxy, Teflon and other coatings are available. See page 150 or contact the factory for further information
- Custom machining and design service are available. See page 146 or contact the factory for further information
- Made in the United States

TYPE E

Split E1000 Cartridge Assembly includes Timken Cups/Cone (extended sleeve) with drive collars, set screws, shim assortment, grease fitting and cartridge stop.

TYPE E APPLICATION GUIDE

TYPE E

At Moline, our goal is to provide you with the most reliable products, helpful service, and expert support. We work to make our application guides clear and easy to understand. But if you have further questions, please contact us. 800.242.4633

LUBRICATION - VARIOUS OPERATIONS

Normal Operation

Your Moline bearing has been greased at the factory and is ready to install and run. When establishing a re-lubrication schedule, note that a small amount of grease at frequent intervals is preferable to a large amount of grease at infrequent intervals. Table 1 below is a general guide for Lubrication. It should be noted that certain conditions may require a change of lubricating periods as dictated by experience.

High Speed Operation

At higher operating speeds, too much grease may cause overheating. In these cases, the amount of lubrication can only be determined by experience. If excess grease in the bearing causes overheating, it will be necessary to remove the grease fitting and run for 10 minutes. This will allow excess grease to escape. Then wipe off excess grease and replace the grease fitting.

Operating Temperatures

Normal temperature may range from “cool or warm to the touch” up to a point of “too hot to touch for more than a few seconds,” depending on the bearing size, speed and surrounding conditions. Abnormally high bearing temperature may indicate faulty lubrication practices and/or misalignment. Unusually high temperature accompanied by excessive leakage of grease indicates too much grease. High temperature with no grease showing at the seals, particularly if the bearing is noisy, usually indicates too little grease.

Special Operating Conditions

Refer acid, chemical, extreme or other special operating conditions to the factory.

LUBRICATION INSTRUCTIONS

All Moline bearings are factory lubricated with No. 2 consistency lithium base grease that is suitable for most normal applications. Many ordinary cup greases will disintegrate at speeds far below those at which Moline bearings will operate successfully if proper grease is used. Relubricate with lithium base grease or a grease that is compatible with original lubricant and suitable for roller bearing service. It should be noted that when re-lubricating, adding a small amount of grease on a frequent basis is preferable to a large amount of grease infrequently. In unusual cases consult the factory or a reputable grease supplier.

Storage or Special Shutdown

If equipment will be idle for some time, before shutting down, add grease to the bearing, rotating the sleeve to distribute grease. If possible, cover the bearing to protect from dust and other contaminants. This will ensure protection of the bearing, particularly when exposed to severe environmental conditions. After lengthy storage, add a small amount of fresh grease before running.

TABLE 1 - LUBRICATION CHART

HOURS RUN PER DAY	SUGGESTED LUBRICATION PERIOD IN WEEKS							
	1 TO 250 RPM	251 TO 500 RPM	501 TO 750 RPM	751 TO 1000 RPM	1001 TO 1500 RPM	1501 TO 2000 RPM	2001 TO 2500 RPM	2501 TO 3000 RPM

24	12	5	3	2	1	1	1	1

Read Operations and Lubrication sections above before establishing lubrication schedule.

TYPE E APPLICATION GUIDE

After choosing the best bearing, make sure you specify the optimal grease for the application. We use premium Timken™ All Purpose lithium grease to assemble our bearings.

Moline Bearing has access to many of the differing Lubricants on the market today. If you have special or specific performance requirements from the lubricant used for your application, please contact us with the details and we will be glad to accommodate your request.

RADIAL/THRUST LOAD RATINGS

Moline Type E bearings have the capacity to carry heavy radial, thrust, and combined radial/thrust loads. The maximum recommended load which can be applied is limited by various components in the system, such as the bearing, housing, shaft, shaft attachment, speed and life requirements as listed in this catalog.

Select a bearing from the Type E Radial Load Ratings selection chart in pages 48-51 having a radial load rating at the operating speed equal to or greater than the calculated "Equivalent Radial Load" for a desired L10 life. This simple method is all that is required for the majority of applications and provides for occasional average shock loads. (Equivalent Radial Load = P). L10 Hours of Life is the life that may be expected from at least 90% of a given group of bearings operating under identical conditions.

For L10 Hours of Life other than those listed in the Type E Radial Load Ratings selection chart in pages 48-51, multiply the Equivalent radial load by one of the following factors:

For 50,000 L10 Hours of Life use the factor of 1.16; 80,000 - 1.34. Then select a bearing from the bold face (30000) L10 ratings only in the selection chart having a rating equal to or greater than this value.

TYPE E APPLICATION GUIDE CONTINUED

TYPE E

Heavy Service

For heavy shock loads, frequent shock loads or severe vibrations, add up to 50% (according to severity of conditions) to the Equivalent Radial Load to obtain a modified radial load.

Thrust load values shown in the table below are recommended as a guide for normal applications that will give adequate L10 life. Where substantial radial load is also present, it is advisable to calculate the L10 life to assure it meets the requirements. The effectiveness of the shaft attachment to carry thrust load depends on proper tightening of the set screws, shaft tolerance, and shaft deflections. Therefore, it is advisable to use auxiliary thrust carrying devices such as shaft shoulder, snap ring, or a thrust collar to locate the bearing under heavier thrust loads or where extreme reliability is desired.

RPM RANGE	20-200	201-2000	OVER 2000
Recommended Thrust Load	C90/4	C90/8	C90/12

The shaft tolerances recommended in [Table 2](#) on page 44 are adequate under normal radial, thrust, and combination radial/thrust load applications. The radial load is limited by the attachment to the shaft (see table on following page 43). Since the allowable load, especially at low speed, is very large, the shaft should be checked to assure adequate shaft strength.

The magnitude and direction of both the thrust and radial load must be taken into account when selecting a housing. When pillow blocks are utilized, heavy loads should be directed through the base. Where a load pulls the housing away from the mounting base, both the hold down bolts and housing must be of adequate strength. Auxiliary load carrying devices such as shear bars are advisable for side or end loading of pillow blocks and radial loads for flange units.

To determine the L10 hours of life for loads and RPM's not listed, use the following equation:

$$L_{10} = \left(\frac{C_{90}}{P} \right)^{10/3} \times \frac{1,500,000}{\text{RPM}}$$

Where:

L₁₀ = Life, hours

C₉₀ = Dynamic Capacity, lbs. (page 43)

P = Equivalent Radial Load, lbs.

When the load on a two row roller bearing is solely a radial load with no thrust (axial) load, the load is shared equally by both rows of rollers and the equivalent load is the same as the actual load. However, when a thrust (axial) load is applied, the loading on the two rows is shared unequally depending on the ratio of thrust to radial load. The use of the X (radial factor) and Y (thrust) factor from the table on page 43. convert the actual applied thrust and radial loads to equivalent radial load which has the same effect on the life of a bearing as a radial load of this magnitude.

$$P = XFR + YFA$$

Where:

P = Equivalent radial load, lbs.

FR = Radial load, lbs.—

(see page 37 for allowable slip fit maximum)

FA = Thrust (axial) load, lbs.

e = Thrust load to radial load factor (page 43)

X = Radial load factor (page 43)

Y = Thrust load factor (page 43)

To find X and Y, first calculate FA/FR and compare to e. Determine X and Y from the Thrust Factors and Seal Speeds chart on page 43. Light Thrust FA/FR less than or equal to e or heavy thrust FA/FR greater than e.

Substitute all known values into the equivalent radial load equation. The equivalent radial load (P) thus determined can be used in the L₁₀ life formula or compared to the allowable equivalent radial load rating desired in the expanded rating table to select a bearing.

If the calculated value of P is less than FR then use P = FR.

* C90—Dynamic capacity based on a rated life of 90 million revolutions or 3,000 hours at 500 RPM.

** If load exceeds maximum allowable slip fit radial load, snug to light press fit of shaft is required.

TYPE E APPLICATION GUIDE CONTINUED

TYPE E

MOUNTING INSTRUCTIONS

It is critical to the performance of the bearing that it be mounted properly. Failure to follow proper mounting practice may result in reduced bearing life.

SHAFT DIAMETER	SHAFT TOLERANCES
1 – 1½ 35mm	Plus .0000" to minus .0005" Plus .0000" to minus .013mm
1⅝ – 4 40mm – 100mm	Plus .0000" to minus .0010" Plus .0000" to minus .025mm
4⅞ – 6 110mm – 140mm	Plus .0000" to minus .0015" Plus .0000" to minus .038mm
6⅞ – 7 160mm – 180mm	Plus .0000" to minus .0020" Plus .0000" to minus .051mm

For best results, clean the shaft and bore of the bearing. The shaft should be straight, free of burrs and nicks, and the correct size, [Table 2](#). Lubricate the shaft and bearing bore with grease or oil to facilitate assembly. Slip bearing into position. When light press fit is required, press against the end of the inner ring of bearing. Do not strike or exert pressure on the housings or seals. Bolt the unit to the support, using shims where necessary to align bearing. Use shims that cover across the entire housing base.

Determine the final shaft position and hand tighten set screws firmly onto shaft. If possible, rotate the shaft slowly under load. If there is any strain, or vibration, it could be due to incorrect alignment, a bent shaft or bent supports. Tighten set screws alternately in small increments to the torque value listed [Table 3](#). To ensure full locking of the inner race to the shaft, **after 24 hours of operation the set screws should be retightened.**

SHAFT SIZE IN	SHAFT SIZE MM	SET SCREW SIZE UNC	TORQUE (IN - LBS)
1	25	¼ – 20	80

4 ⅞ - 4 ½	110 - 115	⅝ – 11	1325
4 ⅞ - 5	125	⅝ – 11	1325
5 ⅞ - 6	130 - 150	¾ – 10	2150
6 ⅞ - 7	160 - 180	¾ – 10	2150

SPLIT E1000 MOUNTING GUIDE

FITTING OR REPLACING A CARTRIDGE IN A SPLIT E1000 PILLOW BLOCK HOUSING

1. Please note that each Moline Split E1000 Bearing has been properly assembled at the factory as a “paired” and “installation ready” Complete Unit. Top Housings and Base Housings are paired and are not interchangeable. Shims should NOT be removed.
2. When disassembling or reassembling, all component parts should be kept clean. All mating surfaces should be clean as any buildup or debris will result in incorrect bearing assembly and performance.
3. Moline Split E1000 Housings have Dowel Pins which ensure mating of the Top and Base Housings to accurately align when reassembling.

4. Prior to lubrication and assembly, ensure that the Housing Bore is free of any old buildup or debris. Lightly lubricate the Top and Base Housing Bore with Anti-Seize compound before installing the Cartridge.
5. Fit Cartridge into the mounted Base Housing making sure to center and orient the Cartridge properly. Align the Grease Fitting with the Grease Access Port in the Top Housing. Then fit the Top Housing, securing it first by loosely tightening the Top Bolts to firmly hold all of the component parts while adjusting and aligning the Cartridge and shaft.
6. If needed, and only after proper and accurate measurement, add or remove shims between Top Housing and Base Housing as required to obtain a “snug” fit of Cartridge in the Complete Unit with Top Bolts tightened to the specified torque in [Table 4](#).

TABLE 4 - TOP BOLT TORQUE (GRADE 8 BOLTS)

BORE SIZE	BOLT SIZE INCHES UNC	TORQUE FT - LBS
1 ³ / ₁₆ - 1 ¹ / ₄	⁵ / ₁₆ - 18	20-25
1 ³ / ₈ - 1 ⁷ / ₁₆	⁵ / ₁₆ - 16	35-45
1 ¹ / ₂ - 1 ¹¹ / ₁₆	⁵ / ₁₆ - 16	35-45
1 ³ / ₄ - 2	³ / ₈ - 14	55-70
2 ³ / ₁₆	³ / ₈ - 14	55-70
2 ¹ / ₄ - 2 ¹ / ₂	³ / ₈ - 13	85-110
2 ¹¹ / ₁₆ - 3	¹ / ₂ - 13	85-110
3 ³ / ₁₆ - 3 ¹ / ₂	¹ / ₂ - 11	170-210
3 ¹⁵ / ₁₆ - 4	⁵ / ₈ - 11	170-210
4 ⁷ / ₁₆ - 4 ¹ / ₂	⁵ / ₈ - 10	300-380
4 ¹⁵ / ₁₆ - 5	⁵ / ₈ - 10	300-380

SPLIT E1000 MOUNTING GUIDE

7. Check for a “snug” fit by gently moving the Cartridge so as not to damage the grease fitting, this can be performed with a small wide blade screwdriver against the base or cartridge stop of the Grease Fitting through the Grease Access Port located in the Top Housing. Please note that care must be taken to avoid damage to the Grease Fitting due to excessive force.
8. The “snug” fit becomes a matter of judgment. A “loose” or “sloppy” fit may allow the Cartridge to move in its Top and Base Housing thus wearing the mating surfaces and Housing Bore. Too tight of a fit will not permit the unit to move and compensate for misalignment and for shaft deflection caused by belt pull and dead weight.
9. Install bearings as per the following installation instruction
6. Position and mount Base Housing to the proper mounting surface on your equipment. Insert and hand tighten Base Bolts so that the Base Housing is free to move during alignment. Once the correct position is affirmed you will tighten to your equipment’s specific torque requirements. For heavy loads and high-speed applications, use Grade 8 Base Bolts for mounting.
7. Loosen set screws in Cartridge collar and slide Cartridge into position on the shaft.
8. Accurately place the Cartridge and Shaft into the center of the Base Housing. For expansion bearings locate unit in center of its axial travel or at extreme if maximum expansion is required.

INSTALLATION OF ALL BEARINGS

1. Moline Split E1000 Bearings are assembled and shipped using Grade 8 Bolts. Use of Grade 8 Bolts allows for installation in Light, Medium and Heavy Load applications.
2. Please note that a Moline Split E1000 Bearing has been properly assembled at the factory as a “paired” and “installation ready” Complete Unit. Top Housings and Base Housings are paired and are not interchangeable. Shims should NOT be removed.
3. Clean all mating surfaces as any buildup or debris will result in inaccurate bearing assembly and performance. Inspect the Shaft, Housing Bore and Cartridge of the bearing. At this point check for burrs or nicks that would inhibit performance.
9. Keeping the Top Bolts in the Top Housing slightly loose with a proper tension will allow the Cartridge free movement to align within the Housing. If Top Bolts are too tight the Cartridge will not align properly within the Housing. If needed for proper adjustment the Base Bolts can be slightly loose during alignment so that the Complete Unit can move if needed on the shaft. Maintaining a proper tension during adjustment and setup will help prevent pre-loading or inducing an initial thrust on the bearing.
10. Check to ensure that all Base Bolts have been tightened to your equipment’s specific torque requirements.
11. Always replace the Grease Fitting protective Grease Cover/Product Tag.
12. Within the first 24 hours of operation, recheck the Top Bolts - Table 4, Set Screws - Table 3, and Base Housing Bolts to the correct torque specifications.

INSTALLATION FOR MEDIUM SPEEDS WITH NORMAL AND HEAVY LOADS

4. The following steps can be applied to both Expansion and Non-Expansion bearing set-up.
5. Clean the shaft and Bore. Lubricate with light oil.

INSTALLATION FOR HIGH SPEEDS WITH LIGHT LOADS

13. Follow previous steps 1 thru 12 first.
14. For applications that operate at high speeds (above 75% of rated speed) or under light loads (less than 2% of Dynamic Capacity) follow the below instructions.

SPLIT E1000 MOUNTING GUIDE

15. Due to the High Speeds and Light Loads, accurate alignment is essential.

For Expansion Units:

- Expansion type housings should be placed so the Cartridge can move freely in either direction evenly on the shaft.
- If maximum travel is needed due to greater shaft expansion move the Cartridge to the desired position. Make sure to keep the Grease fitting collar base or stop pin from hitting and restricting free movement.

For Non-Expansion Units:

- Mount a dial indicator on the shaft near the Cartridge face. Place the dial indicator probe so that it contacts the machined surface of the Cartridge Housing, perpendicular to the face of the Cartridge.
- Zero the indicator and sweep or rotate the machined face 360°, noting the total indicator turnout.
- If the total indicator turnout is less than or equal to the value shown on Table 5, tighten the Housing Top Bolts per Table 4.

TABLE 5 - TOTAL INDICATOR RUN-OUT (TIR)

BORE SIZE	TIR
1 ³ / ₁₆ - 1 ¹ / ₄	0.0028
1 ³ / ₈ - 1 ⁷ / ₁₆	0.0030
1 ¹ / ₂ - 1 ¹¹ / ₁₆	0.0035
1 ³ / ₄ - 2	0.0040
2 ³ / ₁₆	0.0040
2 ¹ / ₄ - 2 ¹ / ₂	0.0045
2 ¹¹ / ₁₆ - 3	0.0055
3 ³ / ₁₆ - 3 ¹ / ₂	0.0065
3 ¹⁵ / ₁₆ - 4	0.0070
4 ⁷ / ₁₆ - 4 ¹ / ₂	0.0080
4 ¹⁵ / ₁₆ - 5	0.0085
5 ⁷ / ₁₆ - 7	0.0090

- If the total indicator turnout is greater than shown on Table 5, gently tap the machined face of the Cartridge Unit Housing until the total indicator turnout is less than or equal to the value shown on Table 5.
- Once Total Indicator Reading (TIR) is achieved, torque the housing Top Bolts per Table 4.
- Rotate the shaft and indicator dial again to verify that the total indicator turnout is still less than or equal to the value shown on Table 5.

- Once Cartridge is accurately placed, tighten Top Bolts to values shown in Table 4.
- Tighten Cartridge Collar Set Screws to the torque values shown in Table 3.
- Turn shaft several revolutions to allow alignment of Cartridge(s) in their respective housings. Re-check and re-tighten Top Bolts of both expansion and non-expansion Housings to recommended torque shown in Table 4.
- Proactive inspection and maintenance of all equipment is critical to healthy bearing life.
- Always replace the Grease Cover/Product Tag after lubrication.
- Within the first 24 hours of operation, recheck the Top Bolts - Table 4, Set Screws - Table 3, and Base Housing Bolts to the correct torque specifications.

Note: Because the allowable loads, especially at low speeds, are extremely high, be sure the shaft strength is adequate and pillow blocks are base loaded. When imposed load is horizontal, be sure hold-down bolts are adequate. If bearings are cap loaded, full details on load, speed and shaft size should be referred to Moline Bearing Company. Consult Moline for speeds and loads greater than listed.

*“Minimum Hours Life” (L10) is the life expected from at least 90% of a given group of bearings operating under identical conditions (proper installation, correct alignment and maintenance). Average life will be approximately five times the minimum life.

* True Type E = Cartridge assembled with Timken Enhanced DEE Cone (highest load rating), made in the USA.

** True Type E = Cartridge assembled with Timken DE Cone.

Can dimensionally interchange with standard Moline Type E, ME2000 and ME3000 Pillow Block Units.

This is a general dimensional interchange, for exact comparison information, please contact the factory.

For Nomenclature see pages 240-241.

M2000

SPHERICAL
ROLLER
BEARINGS

Moline M2000 Mounted Spherical Roller Bearings are suitable for a wide variety of applications. They work exceptionally well in situations where a high capacity align-able bearing is required. They are available in a wide range of shaft sizes and a variety of popular mounts.

Moline M2000 Pillow Blocks, 4-Bolt Flange Bearings, Piloted Flange Bearings and Wide Slot Take-up Bearings are ready to slip onto the shaft when received because they are completely assembled, adjusted, sealed and pre-lubricated at the factory. The self-aligning feature provides for speedy mounting with a minimum of field adjustment required. The housings are ruggedly designed and made in the USA of Class 30 cast iron. There is no danger of bearing failure resulting from dirt or dust entering the bearing before or during installation. Such contamination is very difficult to prevent in bearings that are not shaft ready. No time or expense is required for cleaning housings or initial lubrication. Therefore, overall cost is less in many instances. Operating expense over time is also generally less.

Our M2000 bearings are interchangeable with other collar mounted spherical roller bearings in single piece housings, and are equipped with bearings that have excellent load characteristics.

Standard on all Moline M2000 bearings is a specially designed triple-lip contact seal that prohibits entry of contaminants, retains lubrication and is self-purging. In addition, these bearings are also available with a spring loaded Garter seal for extreme conditions and a balanced Labyrinth seal for high-speed applications.

Moline M2000 bearings are available in expansion (red metal tag) and non-expansion (yellow metal tag) styles. The expansion units have the capacity to move up to .100". The bearings are available in shaft sizes from 1³/₁₆" up to 5" and 40 to 130mm.

All Moline housings come with a standard paint finish. Custom Colors, Powder Coating, Stainless Steel Powder coating, Nickel plating, Epoxy and Teflon coatings will be quoted on request.

Moline M2000 mounted bearings are carried in Moline warehouses and distributor stocks throughout the United States and in Canada.

Set screws secure cone to shaft

Large diameter rollers for optimum capacity

Solid cast iron housing with center support
Made in the USA

Triple-lip contact type seals

Elongated bolt holes permit adjustment and increased mounting options

MOLINE M2000 SPHERICAL ROLLER BEARINGS

SKF SKF INSERT INSIDE

TIMKEN TIMKEN INSERT INSIDE

FEATURES OF MOLINE M2000 SPHERICAL ROLLER BEARINGS

WITH SKF® OR TIMKEN™ ROLLER BEARINGS

- For applications that require expansion and misalignment capability
- Dimensionally interchangeable with competitive Spherical Roller Bearing units, Moline M3000
- Suggested Industry Applications: Conveying, Screening, Air Handling, Food Processing, Paper and Forestry
- Available in shaft sizes from 1-¹³/₁₆" to 5"; and 40mm to 130mm
- Assembled, adjusted and pre-lubricated in advance for immediate use
- Machined and assembled in the USA
- Built with SKF™ and Timken™ Spherical Roller Bearings
- Standard units have one Locking Collar, Double Collar Spherical (D) insert option is available
- +/- 1½° misalignment capacity
- Available in Expansion (red tag) and Non-Expansion (yellow tag) styles
- Expansion units have .100" capacity
- Will accommodate moderate thrust loads and permits angular misalignment without loss of capacity
- Piloted Flange housings are machined with back-out holes
- Single piece outer race is grooved and has 3 lube holes for even distribution of grease)
- Precision ground contours
- Rotating center guide ring for least possible friction
- Available with Standard Triple Lip Contact, Balanced Steel and Teflon Labyrinth, and Spring Loaded Garter Seals
- Timken™ Lithium Complex Grease operating temperature is up to 250°, High temperature grease is available up to 350°
- For custom lubrication, please see page 154 or contact the factory for more information
- Housings of Class 30 Cast Iron made in Illinois, Iowa and Wisconsin
- Housings available in the standard painted finish. Powder coating in RAL or custom colors, Stainless Steel Powder coating, Nickel-plating, Epoxy, Teflon and other coatings are available. See page 150 or contact the factory
- Custom machining and design service are available. See page 146 or contact the factory for further information
- Made in the United States

MOLINE BEARING CO

M2000 APPLICATION GUIDE

At Moline, our goal is to provide you with the most reliable products, helpful service, and expert support. We work to make our application guides clear and easy to understand. But if you have further questions, please contact us. 800.242.4633

LUBRICATION - VARIOUS OPERATIONS

Normal Operation

Your Moline bearing has been greased at the factory and is ready to install and run. When establishing a re-lubrication schedule, note that a small amount of grease at frequent intervals is preferable to a large amount of grease at infrequent intervals. Table 2 below is a general guide for Lubrication. It should be noted that certain conditions may require a change of lubricating periods as dictated by experience.

High Speed Operation

At higher operating speeds, too much grease may cause overheating. In these cases, the amount of lubrication can only be determined by experience. If excess grease in the bearing causes overheating, it will be necessary to remove the grease fitting and run for 10 minutes. This will allow excess grease to escape. Then wipe off excess grease and replace the grease fitting.

Operating Temperatures

Normal temperature may range from “cool or warm to the touch” up to a point of “too hot to touch for more than a few seconds,” depending on the bearing size, speed and surrounding conditions. Abnormal bearing temperature may indicate faulty lubrication practices. Unusually high temperature accompanied by excessive leakage of grease indicates too much grease. High temperature with no grease showing at the seals, particularly if the bearing is noisy, usually indicates too little grease.

Special Operating Conditions

Refer acid, chemical, extreme or other special operating conditions to the factory.

LUBRICATION INSTRUCTIONS

Moline bearings have been lubricated at the factory with No. 2 consistency lithium base grease that is suitable for normal operating applications. Many ordinary cup greases will disintegrate at speeds far below those at which Moline bearings will operate successfully if proper grease is used. Relubricate with lithium base grease or a grease that is compatible with original lubricant and suitable for roller bearing service. It should be noted that when re-lubricating, adding a small amount of grease on a frequent basis is preferable to a large amount of grease infrequently. In unusual cases consult the factory or a reputable grease supplier.

Storage or Special Shutdown

If equipment will be idle for some time, before shutting down, add grease to the bearing, rotating the sleeve to distribute grease. If possible, cover the bearing to protect from dust and other contaminants. This will ensure protection of the bearing, particularly when exposed to severe environmental conditions. After lengthy storage, add a small amount of fresh grease before running.

TABLE 2 - LUBRICATION CHART								
HOURS RUN PER DAY	SUGGESTED LUBRICATION PERIOD IN WEEKS							
	1 TO 250 RPM	251 TO 500 RPM	501 TO 750 RPM	751 TO 1000 RPM	1001 TO 1500 RPM	1501 TO 2000 RPM	2001 TO 2500 RPM	2501 TO 3000 RPM
8	12	12	10	7	5	4	3	2
16	12	7	5	4	2	2	2	1
24	12	5	3	2	1	1	1	1

Read Operations and Lubrication sections above before establishing lubrication schedule.

M2000 APPLICATION GUIDE

Moline spherical bearings have the capacity to carry substantial radial loads, thrust loads or a combined radial and thrust load. The maximum load that can be applied is limited by the various components in the system, and the life requirements listed in this catalog. The factory should be consulted on any application that exceeds the recommendations in the catalog.

MOUNTING INSTRUCTIONS

It is critical to the performance of the bearing that it be mounted properly. Failure to follow proper mounting practice may result in reduced bearing life.

INSTALLATION INSTRUCTIONS

M2000 Non-Expansion Bearing Applications

1. Clean shaft and bore of bearing. The shaft should be straight, free of burrs and nicks, and the correct size.
2. Lubricate shaft and bearing bore with grease or oil to facilitate assembly. Slip bearing into position. When light press fit is required, press against the end of the inner ring of bearing. Do not strike or exert pressure on the housing or seals.
3. Bolt bearing to support, using shims where necessary to align bearing. Use full shims that cover the entire housing base.
4. Determine final shaft position and hand tighten screws in the locking collar(s) of non-expansion bearing firmly onto the shaft, while the other bearings remain free. If possible, rotate the shaft slowly under load to properly center the rolling elements with respect to the raceways. Tighten set screws alternately in small increments to the torque value specified in Table below. To ensure full locking of the inner race to the shaft, **after 24 hours of operation the setscrews should be retightened to the original torque value below.**

SHAFT SIZE		SET SCREW SIZE	TORQUE IN – LBS
IN	MM		
1 ³ / ₁₆ – 2 ¹ / ₄	40 – 55	3/8 – 24	290
2 ⁷ / ₁₆ – 3 ¹ / ₂	60 – 90	1/2 – 20	620
3 ¹⁵ / ₁₆ – 5	100 – 130	5/8 – 18	1325

5. Check rotation. If there is any strain, irregular rotational torque or vibration, it could be due to incorrect alignment, bent shaft or bent supports. Installation should be rechecked and correction made where necessary.

M2000 Expansion Bearing Applications

1. Clean shaft and bore of bearing. The shaft should be straight, free of burrs and nicks, and the correct size.
2. Lubricate shaft and bearing bore with grease or oil to facilitate assembly. Slip bearing into position. When light press fit is required, press against the end of the inner ring of bearing. Do not strike or exert pressure on the housing or seals.
3. Position expansion bearing in the housing. For normal expansion conditions, the bearing insert should be positioned in the center of the housing. To center bearing insert in housing, move bearing insert to extreme position (-.100" on all expansion units) and mark shaft. Then using bearing maximums total expansion table, move bearing insert in opposite direction one-half the total expansion to center bearing in the housing. If maximum expansion is required, move bearing insert to the extreme position in the housing to permit full movement in direction of expansion. After the expansion bearing has been positioned in the housing, tighten the set screws in the locking collar securely to the shaft to the recommended torque.
4. Check rotation. If there is any strain, irregular rotational torque or vibration, it could be due to incorrect alignment, bent shaft or bent supports. Installation should be rechecked and correction made where necessary.

Bearing Maximum Total Expansion

All Expansion Units have - .100" Capacity
Misalignment Capacity = +/- 1¹/₂°

M2000 APPLICATION GUIDE

Select a bearing from the M2000 load-rating chart on pages 82-83, having a radial load rating at the operating speed equal to or greater than the calculated Equivalent Radial Load for a desired L10 life. This simple method is all that is necessary for most general applications and provides for occasional shock loads.

L10 Hours of Life - Is the life that may be expected from at least 90% of a given group of bearings operated under identical conditions. The average life (L50) will be approximately five times the L10 life. To determine the L10 hours of life for loads and RPM's not listed, use the following equation.

$$L_{10} = \left(\frac{C}{P}\right)^{10/3} \times \frac{16667}{\text{RPM}}$$

Where: C= Dynamic Capacity (See Table below)
P= Equivalent Radial Load

If the load on a double row spherical bearing is only in a radial direction (no axial load), the Equivalent Radial Load (P) is equal to the actual radial load. In situations where the bearing load consists of radial and thrust loads, the total load must be converted into an Equivalent Radial Load by the equation:

$$P = XF_R + YF_A$$

Where:
FA = Axial (thrust) Load – see page 81 for maximum
FR= Radial Load
X= Radial Load Factor
(page 81)
Y= Thrust Load Factor
(page 81)

To find the X and Y values, first calculate FA/FR. Then use the M2000 Thrust Factors and Seal Speeds table on the following page to determine the appropriate values for X and Y. Substitute all known values into the Equivalent Radial Load equation.

For longer L10 hours other than 30,000 hours and not shown, multiply the Equivalent Radial Load by one of the following factors: for 20,000 L10 hours life, use a factor of .87; for 40,000 L10 hours of live, use 1.25; and for 80,000 L10 hours of live, use 1.38.

In applications that have heavy shock loads, frequent shock or severe vibrations, add up to 50% to the Equivalent Radial Load to obtain a modified Equivalent Radial Load. The amount of load added is relative to the severity of the application. Additional assistance can be obtained by consulting with the factory.

The shaft tolerances noted in the chart below are sufficient for normal applications. As noted in the following, "Thrust Factors and Seal Speeds" table on the following page 81, extremely heavy radial loads may require a light to snug press fit onto the shaft.

SHAFT SIZE		SHAFT TOLERANCES
IN	MM	
1 ³ / ₁₆ – 1 ¹ / ₂	---	Plus .0000" to minus .0005"
1 ⁵ / ₈ – 4	40 – 100	Plus .0000" to minus .0010"
4 ⁷ / ₁₆ – 5	110 – 130	Plus .0000" to minus .0015"

The magnitude and direction of both the thrust and radial load must be taken into account when selecting the housing. When pillow blocks are used, heavy loads should be directed through the base. If the bearing must be used in a situation where the load pulls the housing away from the mounting base, both the hold down bolts and housing must be of adequate strength. Auxiliary load carrying devices such as shear bars are advisable for side or end loading of pillow blocks and radial loads for flange units.

M2000 APPLICATION GUIDE

* Comparing Spherical to Tapered Roller Bearings—The dynamic capacity C (Spherical) and C90 (Tapered) are not the same base. To compare basic dynamic capacities, multiply C x .259 and compare to C90.

** If load exceeds maximum allowable slip fit radial load, snug to light press fit of shaft is required.

For applications that exceed the load ratings listed above, Moline can assemble units with a higher rated spherical insert. Please contact the factory.

FEATURES OF MOLINE ME2000 SPHERICAL ROLLER BEARINGS WITH TYPE E DIMENSIONS

WITH TIMKEN™ SPHERICAL ROLLER BEARINGS

- For applications that require expansion and misalignment capability and a Type E dimensional “footprint”
- Dimensionally interchangeable with competitive Spherical Roller Bearing units, Moline Split E1000, Moline ME3000
- Suggested Industry Applications: Conveying, Screening, Air Handling, Laundries, Food Processing, Paper and Forestry
- Available in shaft sizes from 1 7/16" to 5"; and 40mm to 130mm
- Assembled, adjusted and pre-lubricated in advance for immediate use
- Machined and assembled in the USA
- Built with SKF™ and Timken™ Spherical Roller Bearings
- Standard units have one Locking Collar, Double Collar Spherical (D) insert option is available in selected sizes
- +/- 1 1/2° misalignment capacity
- Available in Expansion (red tag) and Non-Expansion (yellow tag) styles
- Expansion units have .100" capacity
- Will accommodate moderate thrust loads and permits angular misalignment without loss of capacity
- Piloted Flange housings are machined with back-out holes
- Single piece outer race is grooved and has 3 lube holes for even distribution of grease
- Precision ground contours
- Rotating center guide ring for least possible friction
- Available with Standard Triple Lip Contact, Balanced Steel and Teflon Labyrinth, and Spring Loaded Garter Seals
- Timken™ Lithium Complex Grease operating temperature is up to 250°, High temperature grease is available up to 350°
- For custom lubrication, please see page 154 or contact the factory for more information
- Housings of Class 30 cast iron are made in Illinois, Iowa and Wisconsin
- Housings available in the standard painted finish. Powder coating in RAL or custom colors, Stainless Steel Powder coating, Nickel-plating, Epoxy, Teflon and other coatings are available. See page 150 or contact the factory
- Custom machining and design service are available. See page 146 or contact the factory for further information
- Made in the United States

ME2000 APPLICATION GUIDE

At Moline, our goal is to provide you with the most reliable products, helpful service, and expert support. We work to make our application guides clear and easy to understand. But if you have further questions, please contact us. 800.242.4633

LUBRICATION - VARIOUS OPERATIONS

Normal Operation

Your Moline bearing has been greased at the factory and is ready to install and run. When establishing a re-lubrication schedule, note that a small amount of grease at frequent intervals is preferable to a large amount of grease at infrequent intervals. Table 2 below is a general guide for Lubrication. It should be noted that certain conditions may require a change of lubricating periods as dictated by experience.

High Speed Operation

At higher operating speeds, too much grease may cause overheating. In these cases, the amount of lubrication can only be determined by experience. If excess grease in the bearing causes overheating, it will be necessary to remove grease fitting and run for 10 minutes. This will allow excess grease to escape. Then wipe off excess grease and replace grease fitting.

Operating Temperatures

Normal temperature may range from “cool or warm to the touch” up to a point of “too hot to touch for more than a few seconds,” depending on the bearing size, speed and surrounding conditions. Abnormal bearing temperature may indicate faulty lubrication practices. Unusually high temperature accompanied by excessive leakage of grease indicates too much grease. High temperature with no grease showing at the seals, particularly if the bearing is

noisy, usually indicates too little grease. Normal temperature and a slight showing of grease at the seals indicate proper lubrication.

Special Operating Conditions

Refer acid, chemical, extreme or other special operating conditions to the factory.

LUBRICATION INSTRUCTIONS

Moline bearings have been lubricated at the factory with No. 2 consistency lithium base grease that is suitable for normal operating applications. Many ordinary cup greases will disintegrate at speeds far below those at which Moline bearings will operate successfully if proper grease is used. Relubricate with lithium base grease or a grease that is compatible with original lubricant and suitable for roller bearing service. It should be noted that when re-lubricating, adding a small amount of grease on a frequent basis is preferable to a large amount of grease infrequently. In unusual cases consult the factory or a reputable grease supplier.

Storage or Special Shutdown

If equipment will be idle for some time, before shutting down, add grease to the bearing, rotating the sleeve to distribute grease. If possible, cover the bearing to protect from dust and other contaminants. This will ensure protection of the bearing, particularly when exposed to severe environmental conditions. After lengthy storage, add a small amount of fresh grease before running.

TABLE 2 - LUBRICATION CHART								
HOURS RUN PER DAY	SUGGESTED LUBRICATION PERIOD IN WEEKS							
	1 TO 250 RPM	251 TO 500 RPM	501 TO 750 RPM	751 TO 1000 RPM	1001 TO 1500 RPM	1501 TO 2000 RPM	2001 TO 2500 RPM	2501 TO 3000 RPM
8	12	12	10	7	5	4	3	2
16	12	7	5	4	2	2	2	1
24	12	5	3	2	1	1	1	1

Read Operations and Lubrication sections above before establishing lubrication schedule.

ME2000 APPLICATION GUIDE

Moline spherical bearings have the capacity to carry substantial radial loads, thrust loads or a combined radial and thrust load. The maximum load that can be applied is limited by the various components in the system, and the life requirements listed in this catalog. The factory should be consulted on any application that exceeds the recommendations in the catalog.

MOUNTING INSTRUCTIONS

It is critical to the performance of the bearing that it be mounted properly. Failure to follow proper mounting practice may result in reduced bearing life.

INSTALLATION

ME2000 Non-Expansion Bearing Applications

1. Clean shaft and bore of bearing. The shaft should be straight, free of burrs and nicks, and the correct size.
2. Lubricate shaft and bearing bore with grease or oil to facilitate assembly. Slip bearing into position. When light press fit is required, press against the end of the inner ring of bearing. Do not strike or exert pressure on the housing or seals.
3. Bolt bearing to support, using shims where necessary to align bearing so inner ring does not rub on housing bore. Use full shims which cover across the entire housing base.
4. Determine final shaft position and hand tighten screws in the locking collar(s) of non-expansion bearing firmly onto the shaft, while the other bearings remain free. If possible, rotate the shaft slowly under load to properly center the rolling elements with respect to the raceways. Tighten set screws alternately in small increments to the torque value specified in Table below. To ensure full locking of the inner race to the shaft, **after 24 hours of operation the setscrews should be retightened to the original torque value below.**

SHAFT SIZE		SET SCREW SIZE	TORQUE IN – LBS
IN	MM		
1 ⁷ / ₁₆ – 2 ¹ / ₄	40 – 55	3 ⁸ / ₁₆ – 24	290
2 ⁷ / ₁₆ – 3 ¹ / ₂	60 – 90	1 ² / ₁₆ – 20	620
3 ¹¹ / ₁₆ – 5	100 – 130	5 ⁸ / ₁₆ – 18	1325

5. Check rotation. If there is any strain, irregular rotational torque or vibration, it could be due to incorrect alignment, bent shaft or bent supports. Installation should be rechecked and correction made where necessary.

ME2000 Expansion Bearing Applications

1. Clean shaft and bore of bearing. The shaft should be straight, free of burrs and nicks, and the correct size.
2. Lubricate shaft and bearing bore with grease or oil to facilitate assembly. Slip bearing into position. When light press fit is required, press against the end of the inner ring of bearing. Do not strike or exert pressure on the housing or seals.
3. Position expansion bearing in the housing. For normal expansion conditions, the bearing insert should be positioned in the center of the housing. To center bearing insert in housing, move bearing insert to extreme position (-.100" on all expansion units) and mark shaft. Then using bearing maximums total expansion table, move bearing insert in opposite direction one-half the total expansion to center bearing in the housing. If maximum expansion is required, move bearing insert to the extreme position in the housing to permit full movement in direction of expansion. After the expansion bearing has been positioned in the housing, tighten the set screws in the locking collar securely to the shaft to the recommended torque.
4. Check rotation. If there is any strain, irregular rotational torque or vibration, it could be due to incorrect alignment, bent shaft or bent supports. Installation should be rechecked and correction made where necessary.

Bearing Maximum Total Expansion

All Expansion Units have - .100" Capacity
Misalignment Capacity = +/- 1¹/₂°

ME2000 APPLICATION GUIDE CONTINUED

SPECIAL OPERATING CONDITIONS

Refer acid, chemical, extreme or other special operating conditions to the Moline Bearing Company.

Select a bearing from the ME2000 load-rating chart on page 100 having a radial load rating at the operating speed equal to or greater than the calculated Equivalent Radial Load for a desired L10 life. This simple method is all that is necessary for most general applications and provides for occasional shock loads.

L10 Hours of Life - Is the life that may be expected from at least 90% of a given group of bearings operated under identical conditions. The average life (L50) will be approximately five times the L10 life. To determine the L10 hours of life for loads and RPM's not listed, use the following equation.

$$L_{10} = \left(\frac{C}{P}\right)^{10/3} \times \frac{16667}{\text{RPM}}$$

Where: C= Dynamic Capacity (See Table below)
P= Equivalent Radial Load

If the load on a double row spherical bearing is only in a radial direction (no axial load), the Equivalent Radial Load (P) is equal to the actual radial load. In situations where the bearing load consists of radial and thrust loads, the total load must be converted into an Equivalent Radial Load by the equation:

$$P = XF_R + YF_A$$

Where:
FA = Axial (thrust) Load – see page 99 for maximum
FR= Radial Load
X= Radial Load Factor (page 99)
Y= Thrust Load Factor (page 99)

To find the X and Y values, first calculate FA/FR. Then use the ME2000 Thrust Factors and Seal Speeds table on the following page to determine the appropriate values for X and Y. Substitute all known values into the Equivalent Radial Load equation.

For longer L10 hours other than 30,000 hours and not shown, multiply the Equivalent Radial Load by one of the following factors: for 20,000 L10 hours life, use a factor of .87; for 40,000 L10 hours of live, use 1.25; and for 80,000 L10 hours of live, use 1.38.

In applications that have heavy shock loads, frequent shock or severe vibrations, add up to 50% to the Equivalent Radial Load to obtain a modified Equivalent Radial Load. The amount of load added is relative to the severity of the application. Additional assistance can be obtained by consulting with the factory.

The shaft tolerances noted in the chart below are sufficient for normal applications. As noted in the following, "Thrust Factors and Seal Speeds" table on the following page 99, extremely heavy radial loads may require a light to snug press fit onto the shaft.

SHAFT SIZE		SHAFT TOLERANCES
IN	MM	
1 ⁷ / ₁₆ – 1 ¹ / ₂	40 – 50	Plus .0000" to minus .0005"
1 ¹¹ / ₁₆ – 4	55 – 100	Plus .0000" to minus .0010"
4 ⁷ / ₁₆ – 5	110 – 130	Plus .0000" to minus .0015"

The magnitude and direction of both the thrust and radial load must be taken into account when selecting the housing. When pillow blocks are used, heavy loads should be directed through the base. If the bearing must be used in a situation where the load pulls the housing away from the mounting base, both the hold down bolts and housing must be of adequate strength. Auxiliary load carrying devices such as shear bars are advisable for side or end loading of pillow blocks and radial loads for flange units.

* Comparing Spherical to Tapered Roller Bearings—The dynamic capacity C (Spherical) and C90 (Tapered) are not the same base. To compare basic dynamic capacities, multiply C x .259 and compare to C90.

** If load exceeds maximum allowable slip fit radial load, snug to light press fit of shaft is required.

For applications that exceed the load ratings above, please contact the factory for assistance.

For load requirements higher than those stated above, please contact the factory.

Starting at Sizes 1 ¹⁵/₁₆ add Suffix "D" to part number for Double Collar Spherical.

Assembled with Timken™ Spherical Roller Bearings.

Moline ME2000D can dimensionally interchange with standard Moline Type E, E1000 and ME3000.

This is a general dimensional interchange, for exact comparison information, please contact the factory.

For Nomenclature see pages 240-241.

M3000

EVEN-LOK™

SPHERICAL

ROLLER

BEARINGS

An increasingly popular addition to the Moline line, is the M3000 Even-Lok™ mounted spherical bearing using a built-in mechanical connector that applies a near 360° concentric grip and almost a 100% interface with the surface of the shaft.

This unique locking mechanism helps eliminate vibration and slippage between the mating surfaces.

An excellent choice for screening and conveying, material and air handling, or industrial laundry applications, where there are problems with fretting corrosion, slippage on the shaft, or vibration, Moline's M3000 Even-Lok™ spherical roller bearing will help.

Moline M3000 units require less time and skill to install, saving your maintenance on costly down time and expense.

The M3000 2-Bolt and 4-Bolt Pillow Blocks, 4-Bolt Flange Bearings, Piloted Flange Bearings and Wide Slot Take-up Bearings are ready to slip onto the shaft when received because they are completely assembled, adjusted, sealed and pre-lubricated at the factory. The self-aligning feature provides for speedy mounting with a minimum of field adjustment required. The housings are ruggedly designed and made in the USA of Class 30 cast iron.

The M3000 Even-Lok™ comes with mounting instructions and an Hex-L Key Allen wrench for easy mounting and dismounting.

Our M3000 bearings are comparable to other adapter mounted spherical roller bearings, and are equipped with the SKF Explorer™ Spherical Roller Bearing Insert.

Moline M3000 bearings are available in expansion and non-expansion styles. The expansion units have the capacity to move up to .100". The bearings are available in shaft sizes from 1⁷/₁₆" up to 4".

All Moline housings come with a standard paint finish. Custom Colors, Powder Coating, Stainless Powder coating, Nickel plating, Epoxy and Teflon coatings will be quoted on request. Special machining is also available, please call us at the factory for further information.

Moline M3000 Even-Lok™ Spherical Roller Bearings are carried in Moline warehouses and distributor stocks throughout the United States and in Canada.

Solid cast iron housing,
with center support

MOLINE M3000 EVEN-LOK™ SPHERICAL ROLLER BEARINGS

SKF SKF INSERT INSIDE

FEATURES OF MOLINE M3000 EVEN-LOK™ SPHERICAL ROLLER BEARINGS

WITH SKF® ROLLER BEARINGS

- For applications that require expansion and misalignment capability, or where vibration, slippage or fretting corrosion is present
- Dimensionally interchangeable with comparable competitive Spherical Roller Bearing units and Moline M2000
- Suggested Industry Applications: Conveying, Screening, Air Handling, Industrial Laundries, High Speed Fans
- Available in shaft sizes from 1 7/16" to 4"
- Assembled, adjusted and pre-lubricated in advance for immediate use
- Built with SKF™ Explorer Spherical Roller Bearings
- Supplies near 360° locking around, and near 100% interface with the shaft that eliminates slippage due to vibration
- Supplied with special Hex-L Key Allen wrench for easy mounting and dismounting
- +/- 1 1/2° misalignment capacity
- Available in Expansion (red tag) and Non-Expansion (yellow tag) styles
- Expansion units have .100" capacity
- Compared to traditional set screw locking, concentric locking reduces fretting corrosion
- Distributes locking force equally through Even-Lok™, reducing the risk of particle infiltration in the inner sleeve
- Available with Standard Double Lip Contact Seal made by SKF® or Balanced Steel Labyrinth Seals
- Timken™ Lithium Complex Grease operating temperature is up to 250°, High temperature grease is available up to 350°
- For custom lubrication, please see page 154 or contact the factory for more information
- Housings of Class 30 cast iron are made in Illinois, Iowa and Wisconsin
- Housings available in the standard painted finish. Powder coating in RAL or custom colors, Stainless Steel Powder coating, Nickel-plating, Epoxy, Teflon and other coatings are available. See page 150 or contact the factory
- Custom machining and design service are available. See page 146 or contact the factory for further information
- Made in the United States

Traditional Set
Screw Locking

M3000 EVEN-LOK™ APPLICATION GUIDE

At Moline, our goal is to provide you with the most reliable products, helpful service, and expert support. We work to make our application guides clear and easy to understand. But if you have further questions, please contact us.

800.242.4633

LUBRICATION - VARIOUS OPERATIONS

Normal Operation

Your Moline bearing has been greased at the factory and is ready to install and run. When establishing a re-lubrication schedule, note that a small amount of grease at frequent intervals is preferable to a large amount of grease at infrequent intervals. Table 2 below is a general guide for Lubrication. It should be noted that certain conditions may require a change of lubricating periods as dictated by experience.

High Speed Operation

At higher operating speeds, too much grease may cause overheating. In these cases, the amount of lubrication can only be determined by experience. If excess grease in the bearing causes overheating, it will be necessary to remove grease fitting and run for 10 minutes. This will allow excess grease to escape. Then wipe off excess grease and replace grease fitting.

Operating Temperatures

Normal temperature may range from “cool or warm to the touch” up to a point of “too hot to touch for more than a few seconds,” depending on the bearing size, speed and surrounding conditions. Abnormal bearing temperature may indicate faulty lubrication practices. Unusually high temperature accompanied by excessive leakage of grease indicates too much grease. High temperature with no grease showing at the seals, particularly if the bearing is noisy, usually indicates too little grease. Normal temperature and a slight showing of grease at the seals indicate proper lubrication.

Special Operating Conditions

Refer acid, chemical, extreme or other special operating conditions to the factory.

LUBRICATION INSTRUCTIONS

Moline bearings have been lubricated at the factory with No. 2 consistency lithium base grease that is suitable for normal operating applications. Many ordinary cup greases will disintegrate at speeds far below those at which Moline bearings will operate successfully if proper grease is used. Relubricate with lithium base grease or a grease that is compatible with original lubricant and suitable for roller bearing service. It should be noted that when re-lubricating, adding a small amount of grease on a frequent basis is preferable to a large amount of grease infrequently. In unusual cases consult the factory or a reputable grease supplier.

Storage or Special Shutdown

If equipment will be idle for some time, before shutting down, add grease to the bearing, rotating the sleeve to distribute grease. If possible, cover the bearing to protect from dust and other contaminants. This will ensure protection of the bearing, particularly when exposed to severe environmental conditions. After lengthy storage or idle period, add fresh grease before starting.

TABLE 2 - LUBRICATION CHART

HOURS RUN PER DAY	SUGGESTED LUBRICATION PERIOD IN WEEKS							
	1 TO 250 RPM	251 TO 500 RPM	501 TO 750 RPM	751 TO 1000 RPM	1001 TO 1500 RPM	1501 TO 2000 RPM	2001 TO 2500 RPM	2501 TO 3000 RPM
8	12	12	10	7	5	4	3	2
16	12	7	5	4	2	2	2	1
24	12	5	3	2	1	1	1	1

Read Operations and Lubrication sections above before establishing lubrication schedule.

M3000 EVEN-LOK™ APPLICATION GUIDE

MOUNTING INSTRUCTIONS

It is critical to the performance of the bearing that it be mounted properly. Failure to follow proper mounting practice may result in reduced bearing life.

1. Clean the base of the bearing and support surface on which it rests. Be sure the supporting surface is flat. If the bearing elevation must be adjusted by shims, the shims **MUST** extend the full length and width of the support surface.
2. Slide the bearing, with the mounting side facing outward, on the shaft where the unit is to be secured. Bolt the housing securely to the support. Note: The mounting side of the bearing is the side with the circle of set screws.
3. The Expansion bearing must be centered in the housing to allow for axial shaft expansion. Move the bearing axially in the housing in both directions as far as it will go and determine the centered position. It will be necessary to relieve the bearing load while moving the assembly.
4. Snug the mounting screws located in the mounting side collar to finger tightness holding the short leg of the supplied Even-lok™ wrench. Tighten the mounting screws a total of ½ turn by alternately tightening in two increments (¼ turn and ¼ turn). Please refer to the following diagram for proper tightening pattern for each bearing size:

- Do not remove plastic end cap or plastic protection plugs inserted in the set screw holes (on some older style inserts) until you are ready to install bearing onto shaft.
- Do not disassemble bearing prior to installation.
- **Do not tighten any mounting screws prior to installation.**
- Use only the supplied Even-lok™ wrench for tightening set screws on bearing. After storage or idle period, add a little fresh grease before running.

For optimum bearing performance, it is important to start the mounting process with a shaft that is free of burrs and dirt. Please review your shaft and file down burrs and wipe clean then lubricate shaft with light oil. Check shaft diameter and review recommended shaft tolerances below:

SHAFT DIAMETER	TOLERANCE
1 7/16"–1 15/16"	+.000" to -.003"
2"– 4"	+.000" to -.004"

After choosing the best bearing, make sure you specify the optimal grease for the application.

We use premium Timken™ All Purpose lithium grease to assemble our bearings.

Moline Bearing has access to many of the differing Lubricants on the market today. If you have special or specific performance requirements from the lubricant used for your application, please contact us with the details and we will be glad to accommodate your request.

M3000 EVEN-LOK™ APPLICATION GUIDE CONTINUED

M3000 TIGHTENING PATTERNS

5. Tighten each set screw until the long end of the Even-lok™ wrench bows ½" under finger pressure or torque to 5.5 lb.ft.
Caution: Do not use power driven or auxiliary equipment such as a hammer or pipe in tightening the screws.

6. Check for misalignment.
 7. Secure the mounting bolts to the support structure tightly.
 8. **Within the first 24 hours of operation, recheck the mounting side screws to the correct torque specifications in step 5 above.**

DISMOUNTING INSTRUCTIONS

1. Clean the bearing and shaft extension of any burrs or rust.
2. It is recommended to lift and support the bearing assembly and shaft extension before dismounting.
3. Loosen the set screws in the mounting collar by a few turns. The pre-loaded wave springs inside the locking mechanism will assist to release the bearing sleeve. The bearing should release from the shaft. If not, tap gently with a rubber hammer on the back-up ring located on the opposite side of the bearing, to release the sleeve.
4. Remove the bearing mounting bolts.
5. Slide the bearing unit off the shaft.

SELECTING THE CORRECT SPHERICAL

Moline spherical bearings have the capacity to carry substantial radial loads, thrust loads or a combined radial and thrust load. The maximum load that can be applied is limited by the various components in the system, and the life requirements listed in this catalog. The factory should be consulted on any application that exceeds the recommendations in the catalog. See page 123.

Select a bearing from the M3000 load-rating chart on page 124 having a radial load rating at the operating speed equal to or greater than the calculated Equivalent Radial Load for a desired L10 life. This simple method is all that is necessary for most general applications and provides for occasional shock loads.

L10 Hours of Life – Is the life that may be expected from at least 90% of a given group of bearings operated under identical conditions. The average life (L50) will be approximately five times the L10 life. See page 124.

For further L10 calculations needed to select and verify the correct Spherical for your application, please refer to the text description on page 80 in conjunction with the M3000 Charts on the following page 123 and 124.

FEATURES OF MOLINE ME3000 EVEN-LOK™ SPHERICAL ROLLER BEARINGS WITH TYPE E DIMENSIONS

WITH SKF® ROLLER BEARINGS

- For applications that require expansion and misalignment capability and a Type E dimensional “footprint”
- Dimensionally interchangeable with comparable competitive Spherical Roller Bearing units, Moline Split E1000, Moline ME2000
- Suggested Industry Applications: Conveying, Screening, Air Handling, Industrial Laundries, High Speed Fans
- Available in shaft sizes from 1 7/16" to 4"
- Assembled, adjusted and pre-lubricated in advance for immediate use
- Built with SKF™ Explorer Spherical Roller Bearings
- Supplies near 360° locking around, and near 100% interface with the shaft that eliminates slippage due to vibration
- Supplied with special Hex-L Key Allen wrench for easy mounting and dismounting
- +/- 1 1/2° misalignment capacity
- Available in Expansion (red tag) and Non-Expansion (yellow tag) styles
- Expansion units have .100" capacity
- Compared to traditional set screw locking, concentric locking reduces fretting corrosion
- Distributes locking force equally through Even-Lok™, reducing the risk of particle infiltration in the inner sleeve
- Available with Standard Double Lip Contact Seal made by SKF® or Balanced Steel Labyrinth Seals
- Timken™ Lithium Complex Grease operating temperature is up to 250°, High temperature grease is available up to 350°
- For custom lubrication, please see page 154 or contact the factory for more information
- Housings of Class 30 cast iron are made in Illinois, Iowa and Wisconsin
- Housings available in the standard painted finish. Powder coating in RAL or custom colors, Stainless Steel Powder coating, Nickel-plating, Epoxy, Teflon and other coatings are available. See page 150 or contact the factory for further information
- Custom machining and design service are available. See page 146 or contact the factory for further information
- Made in the United States

For applications that exceed the load ratings above, please contact the factory for assistance.

ME3000 EVEN-LOK™ PILOTED FLANGE CARTRIDGE WITH TYPE E DIMENSIONS

ME3000 EVEN-LOK™ APPLICATION GUIDE

At Moline, our goal is to provide you with the most reliable products, helpful service, and expert support. We work to make our application guides clear and easy to understand. But if you have further questions, please contact us. 800.242.4633

LUBRICATION - VARIOUS OPERATIONS

Normal Operation

Your Moline bearing has been greased at the factory and is ready to install and run. When establishing a re-lubrication schedule, note that a small amount of grease at frequent intervals is preferable to a large amount of grease at infrequent intervals. Table 1 below is a general guide for Lubrication. It should be noted that certain conditions may require a change of lubricating periods as dictated by experience.

High Speed Operation

At higher operating speed, too much grease may cause overheating. In these cases, the amount of lubrication can

only be determined by experience. If excess grease in the bearing causes overheating, it will be necessary to remove grease fittings and run for 10 minutes. This will allow excess grease to escape. Then wipe off excess grease and replace grease fittings.

Operating Temperatures

Normal temperature may range from “cool or warm to the touch” up to a point of “too hot to touch for more than a few seconds,” depending on the bearing size, speed and surrounding conditions. Abnormal bearing temperature may indicate faulty lubrication practices. Unusually high temperature accompanied by excessive leakage of grease indicates too much grease. High temperature with no grease showing at the seals, particularly if the bearing is noisy, usually indicates too little grease. Normal temperature and a slight showing of grease at the seals indicate proper lubrication.

Special Operating Conditions

Refer acid, chemical, extreme or other special operating conditions to the factory.

LUBRICATION INSTRUCTIONS

Moline bearings have been lubricated at the factory with No. 2 consistency lithium base grease that is suitable for normal operating applications. Many ordinary cup greases will disintegrate at speeds far below those at which Moline bearings will operate successfully if proper grease is used. Relubricate with lithium base grease or a grease that is compatible with original lubricant and suitable for roller bearing service. It should be noted that when re-lubricating, adding a small amount of grease on a frequent basis is preferable to a large amount of grease infrequently. In unusual cases consult the factory or a reputable grease supplier.

TABLE 1 - LUBRICATION CHART

HOURS RUN PER DAY	SUGGESTED LUBRICATION PERIOD IN WEEKS							
	1 TO 250 RPM	251 TO 500 RPM	501 TO 750 RPM	751 TO 1000 RPM	1001 TO 1500 RPM	1501 TO 2000 RPM	2001 TO 2500 RPM	2501 TO 3000 RPM
8	12	12	10	7	5	4	3	2
16	12	7	5	4	2	2	2	1
24	12	5	3	2	1	1	1	1

Read Operations and Lubrication sections above before establishing lubrication schedule.

ME3000 EVEN-LOK™ APPLICATION GUIDE

Storage or Special Shutdown

If equipment will be idle for some time, before shutting down, add grease to the bearing, rotating the sleeve to distribute grease. If possible, cover the bearing to protect from dust and other contaminants. This will ensure protection of the bearing, particularly when exposed to severe environmental conditions. After lengthy storage, add a small amount of fresh grease before running.

MOUNTING INSTRUCTIONS

It is critical to the performance of the bearing that it be mounted properly. Failure to follow proper mounting practice may result in reduced bearing life.

- Do not remove plastic end cap or plastic protection plugs inserted in the set screw holes (on some older style inserts) until you are ready to install bearing onto shaft.
- Do not disassemble bearing prior to installation.
- **Do not tighten any mounting screws prior to installation.**
- Use only the supplied Even-lok™ wrench for tightening set screws on bearing. After storage or idle period, add a little fresh grease before running.

For optimum bearing performance, it is important to start the mounting process with a shaft that is free of burrs and dirt. Please review your shaft and file down burrs and wipe clean then lubricate shaft with light oil. Check shaft diameter and review recommended shaft tolerances below:

SHAFT DIAMETER	TOLERANCE
1 7/16"–1 15/16"	+ .000" to -.003"
2"– 4"	+ .000" to -.004"

1. Clean the base of the bearing and support surface on which it rests. Be sure the supporting surface is flat. If the bearing elevation must be adjusted by shims, the shims **MUST** extend the full length and width of the support surface.
2. Slide the bearing, with the mounting side facing outward, on the shaft where the unit is to be secured. Bolt the housing securely to the support. Note: The mounting side of the bearing is the side with the circle of set screws.
3. The Expansion bearing must be centered in the housing to allow for axial shaft expansion. Move the bearing axially in the housing in both directions as far as it will go and determine the centered position. It will be necessary to relieve the bearing load while moving the assembly.
4. Snug the mounting screws located in the mounting side collar to finger tightness holding the short leg of the supplied Even-lok™ wrench. Tighten the mounting screws a total of ½ turn by alternately tightening in two increments (¼ turn and ¼ turn). Please refer to the following diagram for proper tightening pattern for each bearing size:

ME3000 EVEN-LOK™ APPLICATION GUIDE CONTINUED

ME3000 TIGHTENING PATTERNS

5. Tighten each set screw until the long end of the Even-lok™ wrench bows ½" under finger pressure or torque to 5.5 lb.ft.. Caution: Do not use power driven or auxiliary equipment such as a hammer or pipe in tightening the screws.

6. Check for misalignment.
7. Secure the mounting bolts to the support structure tightly.
8. **Within the first 24 hours of operation, recheck the mounting side screws to the correct torque specifications in step 5 above.**

DISMOUNTING INSTRUCTIONS

1. Clean the bearing and shaft extension of any burrs or rust.
2. It is recommended to lift and support the bearing assembly and shaft extension before dismounting.
3. Loosen the set screws in the mounting collar by a few turns. The pre-loaded wave springs inside the locking mechanism will assist to release the bearing sleeve. The bearing should release from the shaft. If not, tap gently with a rubber hammer on the back-up ring located on the opposite side of the bearing, to release the sleeve.
4. Remove the bearing mounting bolts.
5. Slide the bearing unit off the shaft.

SELECTING THE CORRECT SPHERICAL

Moline spherical bearings have the capacity to carry substantial radial loads, thrust loads or a combined radial and thrust load. The maximum load that can be applied is limited by the various components in the system, and the life requirements listed in this catalog. The factory should be consulted on any application that exceeds the recommendations in the catalog. See page 139.

Select a bearing from the ME3000 load-rating chart on page 140 having a radial load rating at the operating speed equal to or greater than the calculated Equivalent Radial Load for a desired L10 life. This simple method is all that is necessary for most general applications and provides for occasional shock loads.

L10 Hours of Life – Is the life that may be expected from at least 90% of a given group of bearings operated under identical conditions. The average life (L50) will be approximately five times the L10 life. See page 140.

For further L10 calculations needed to select and verify the correct Spherical for your application, please refer to the text description on page 98 in conjunction with the ME3000 Charts on the following page 139 and 140.

SPECIALTY
SERVICES

Through a combination of Moline Specialty Services, we provide solutions for a myriad of bearing fit, bearing application and bearing failure challenges.

Whether it's a unique application, spacing requirement, obsolete unit, or up-to-date project, Moline Specialty Services addresses many of the needs and concerns that you face during design, installation and operation.

We work with our customers, field operators and design engineers to source and procure components and processes while taking the most efficient and economical path towards meeting your specific goals and requirements.

Moline is always willing to consider projects and challenges, no matter how small or large...something our competitors won't do.

Engineering, Machining, Fabrication and Assembly Is your customer experiencing bearing failure or broken housings? Is your current bearing no longer in production? Can't find the housing shape or size you need? Let us review your application to offer solutions. We specialize in reverse engineering and improving upon the original design to provide resolution to your bearing challenges.

Coatings and Finishes When you need extra protection for your bearing, or have a unique operating environment, consider using one of our new specialty coatings for your mounted units. Lower your operating costs and extend your bearing service life by protecting your investment with one of our coatings.

Bearing End Caps and Covers Increase the life of your bearings by keeping them clean and free of debris with bearing end caps and bearing covers. Moline offers open and closed end caps, standard bearing covers, and extended shaft bearing covers for all stocked mounted units.

Lubricants After choosing the best Bearing, make sure you specify the optimal grease for the application. Moline has access to many of the differing Lubricants on the market today. If you have special or specific performance requirements from the lubricant used for your application, please contact us with the details and we will be glad to accommodate your request.

Private Label You have worked hard to build your brand and Moline understands this. Take one step further by labeling your mounted units with your company's logo so that the end-user comes back to you for all service and replacement parts. Moline offers onsite design services to make your bearings stand out.

ENGINEERING AND MACHINING SERVICES

SPECIALTY SERVICES

**Has the bearing you need been discontinued?
Is your customer experiencing bearing failure or broken housings?**

Moline Engineers are available to custom design or modify existing housings to resolve any design or operating issues you may encounter. We are available to help troubleshoot. Fast turnaround on small runs, along with low minimum quantities are our specialty.

- We offer specialty housing materials such as ductile iron or machined steel
- In many instances we can modify existing housings to suit a mounting issue or space consideration
- Moline's Engineering Department can reverse engineer discontinued mounted units
- Fast turnaround on small runs and low minimum quantities are our specialty
- We offer specialty seals and seal design solutions to suit a variety of application environments
- High-temp, Low-temp, Solid Lube, Food-Grade greases are available upon request
- Please call the factory for more information, pricing and availability

Product	Customer Problem	Moline Solution/Benefit
Stainless Steel Piloted Flange with Solid Lubricant	Customer sought to eliminate potential corrosion and contamination in a food processing environment.	Moline provided the complete solution with this stainless steel housing, insert and collars to the engineers specifications. We further specified a solid lubricant to ensure containment.

ENGINEERING AND MACHINING SERVICES

Product	Customer Problem	Moline Solution/Benefit
SealMaster SleeveLoc Discontinued by SealMaster	The customer had welded threaded bolts to their machines that only matched the discontinued Sealmaster 3000 flange unit.	Moline machined a steel flange housing with a matched the bolt pattern of the discontinued bearing. The customer was spared the high cost of reworking their existing machinery. 
Dodge B1 Double-Interlock	Customer purchased then performed additional modification of this Dodge cartridge unit.	Moline reverse engineered and performed additional machining within a three week period. The customer saved time and cost of additional machining. Bearing was not contaminated by secondary machining process. 
Browning 950 Discontinued by Browning	Customer designed their equipment around the discontinued Browning 950 pillow block. The bolt pattern and pad height were crucial dimensions.	Moline made a casting that matched dimensions and created a part that was less expensive than original unit. Customer did not have to redesign their equipment or create retrofit kit for existing machines. 
Type E 2-Bolt "Miz" Bearing	Standard cast iron housing was breaking and customer needed to order a small quantity.	Machined a steel housing that matched the bolt pattern with a quick turnaround and at a reasonable cost. 
Grab Roller Bearing #1	The original cast iron design of their agricultural bearing was breaking. An attempt to use a weldment also failed.	Moline provided this housing in ductile iron and increased the thickness of the bolt pad to allow a larger bolt thus decreasing the chance of housing failure. 

SPECIALTY SERVICES

Product	Customer Problem	Moline Solution/Benefit
<p>Grab Roller Bearing #2</p>	<p>Customer could not use traditional pillow block mounting due to space and extreme dirt environment. Bearing was failing due to constant dirt impaction.</p>	<p>Moline manufactured a steel housed unit with tapped base mounting. Machined the housing bore to provide space to install a double set of seals on both sides for increased protection.</p>

Product	Customer Problem	Moline Solution/Benefit
<p>Ball Bearing with Custom Steel Housing for an application in a tight and confined space.</p>	<p>Customer was experiencing broken housings and had limited space for mounting a larger bearing.</p>	<p>Moline custom designed, machined and manufactured steel housing with ER insert and custom locking channel.</p>

COATINGS AND FINISHES

When you need extra protection for your bearing, or have a unique operating environment, consider using one of our new specialty coatings for your mounted bearings.

Let us help you reduce costs by letting Moline handle your coating needs.

While we offer **moline+color** traditional powder coating services in a limitless range of colors, it does not stop there; High temp, Ceramic coatings, Heat dissipation, Stainless Steel powder coating, Anti-microbial epoxy, Nickel plating, Teflon coating and Marine grade coatings are available.

For your OEM customers. All of our coatings exceed customer specifications and requirements, resulting in longer life and a better end product. Custom matching of colors, including small batch runs are no issue. Our capabilities include custom formulations, custom colors, UV resistance, and corrosion protection.

Stainless Steel Coating

Moline can provide a patented stainless steel coating that is highly protective, anti-corrosive and so durable, it will handle high detergent/antibacterial wash downs commonly used in the food industry. Moline can offer an “antimicrobial” finish that is direct contact USDA/FDA Certified for food & consumables.

Specialty Coatings can provide longer bearing life

RAL or custom color matching is available

Reduce costs by letting Moline provide your custom painting or coatings

Protective Stainless Steel Powder Coatings for enhanced corrosion resistance

MOLINE BEARING CO

END CAPS AND BEARING COVERS

Increase the life of your bearings by keeping them clean and free of debris with bearing end caps and bearing covers. Moline offers open and closed end caps, standard bearing covers, and extended shaft bearing covers for all stocked mounted units.

We can custom design to suit your specific needs for almost any operating environment. Fast turnaround on small runs and low minimum quantities are our specialty.

- Our covers are available in standard impact resistant black ABS plastic, other colors and materials also available
- Meets OSHA Safety Standards for all Mechanical Transmission Apparatus
- Specialty sealing, gasket and grease fitting options are offered
- **Heat and Chemical Resistant**- ABS is resistant to most chemical attacks and can withstand 200°F
- **Durable** - ABS and PETG covers will flex to absorb. They will never rust!
- **Sterilizable** - Plastic covers are especially useful in the pharmaceutical and food processing industries, and can be sterilized with steam and most detergent solutions
- **Outdoors Applications** - Both Black ABS and Transparent PETG will work in outdoor applications

END CAPS AND BEARING COVERS

Our most commonly requested **End Caps** are the Open and Closed units pictured below and listed in the chart to the right.

For specific and specialty applications we have wide range of Caps and Covers in stock. Please call Moline to discuss solutions.

Closed and Open, Pillow Block Covers.

Closed, 4-Bolt Flange Cover

Pillow Block Cover with extended Shaft and Seal protection.

SPECIALTY SERVICES

LUBRICANTS

After choosing the best Moline Bearing unit for your application, make sure you specify the optimal grease for your application.

Moline offers a wide variety of Lubricants available on the market today. We offer high temp, low temp, cryogenic and food grade greases often at no additional charge. If you have specific performance requirements of the lubricant used for your application, please contact us with the details and we can help to determine which product and formula works best for your application. We will be glad to accommodate your request.

Timken® Premium All Purpose Industrial LC-2 Grease GR217 - Standard Bearing Grease

- NLGI No. 2 extreme pressure, lithium-complex thickened grease
- Solid protection against rust and corrosion
- Excellent protection against wear
- Applications: Ideal for industrial bearings operating at higher-than-average temperatures and/or subjected to shock loading

Timken® Mill Grease GR182 - High Temp Bearing Grease

- Calcium sulfonate-thickened grease
- Excellent resistance to water washout
- Superior protection against rust and corrosion, including salt spray
- Excellent high-temperature properties
- Timken Mill Grease is formulated with high VI parafinic mineral oil, resulting in very good oxidation stability
- Applications: Steel mills, paper mills, aluminum mills, foundries, cement plants, power generation, off-road applications, mineral processing, offshore rigs and marine applications

Timken® Food Safe Grease GR231 - Food Grade Bearing Grease

- NLGI No. 2 aluminum-complex thickened lubricating grease
- Provides for improved low- and high-temperature performance
- Contains extra-pressure, anti-wear additives and corrosion and oxidation inhibitors
- Applications: Food processing operations

LUBRICANTS

PhyMet® MicroPoly Solid Lubricant

- Creates a solid lubricant with an oil-filled porous structure
- MicroPoly fills the space between the rolling elements and races in a bearing, providing consistent lubrication
- There is no need for additional lubrication during the life of a MicroPoly filled bearing
- Because Phymet is a solid, MicroPoly can help block debris and reduce foreign contamination of the bearing.
- Reducing the incursion of debris into the bearing can significantly extend the bearing's life
- MicroPoly also improves housekeeping, as it will not drip out of the bearing and contaminate the environment
- Cuts downtime and maintenance costs
- Applications: Agriculture, fabrication, food and beverage, mining and lumber, paper and packaging, utilities
- MicroPoly offers a variety of solid lubricant formulas for industrial, high temp, high speed and food grade applications

Grease Type	Purpose	Application	Environment
Timken GR 217	Premium All purpose LC-2 Lithium Complex -40°C to 149°C -40°F to 300°F	Agriculture, Bushings/Ball Joints, Truck and Auto Wheel Bearings, Heavy Duty Industrial	High Wear, Moderate Loads, Moderate Speeds, Moderate Temperatures
Timken GR 182K	Mill Grease Calcium Suifonate -40°C to 204°C -40°F to 400°F	Aluminum Mills, Paper Mills, Steel Mills, Offshore Rigs, Power Generation	Corrosive Media, Extreme Heat, Heavy Loads, Wet Conditions, Slow to Moderate Speeds
Timken GR 231C	Food Safe Aluminum Complex -40°C to 149°C -40°F to 300°F	Food and Beverage Industries, Pharmaceuticals	Incidental Food Contact, Hot and Clod Temperatures, Moderate to High Speeds, Medium Loads
Phymet Micropoly MPI 0800	Premium All Purpose Solid Polymer -23°C to 93°C -10°F to 200°F	Agricultural, Automotive, Heavy Industrial, Printing	Severe and Hard to access and service areas, Low to Moderate Loads, Speeds and Temperatures

GREASE TAG PRIVATE LABEL BRANDING

You have worked hard to build your brand and we understand this. Take one step further by labeling our mounted units with your company's logo so that the end-user comes back to you for all service and replacement parts. A custom grease tag is a small step to greater brand marketing.

Moline offers onsite design services to make your bearings stand out, look good and help your customer find their way back to you for aftermarket sales. Contact us to discuss ways in which we can help your product stand out in a crowd.

MOLINE BEARING CO.

BALL BEARINGS

Moline Mounted Ball Bearings consist of a single row deep groove ball bearing and cast iron housings. These are available in wide range of shaft sizes in 2-Bolt Pillow Blocks, 2-Bolt and 4-Bolt Flanges, Piloted Flange and Wide Slot Take-Up units.

The self-contained bearing with a spherical ground outside diameter is assembled into a corresponding spherical seat of the housing, providing full self-alignment of the bearing in the housing at mounting. Moline's Mounted Ball Bearings are supplied from the factory in shaft-ready condition.

The inner rings of the insert bearings are through hardened in the raceway, while the extended ring where the set screws are installed is metallurgically mild and softened. This unique heat treatment ensures full bearing performance and prevents the set screws from loosening during operation. Thus, the set screws can be tightened as needed without causing cracks on the inner ring.

We sell these bearings as inserts, housings and complete units.

All ball bearing housings come with a standard paint finish.

These Mounted Ball Bearings are carried in Moline warehouses and distributor stocks throughout the United States and in Canada.

They are manufactured overseas for Moline and meet a quality standard set by the bearing industry, except at a lower price point.

FEATURES OF MOLINE MOUNTED BALL BEARINGS

- For applications that require high speed, moderate load and some axial load
- Dimensionally interchangeable with comparable industry standard units
- Suggested Industry Applications: Conveying, Screening, Material Handling, Food and Beverage
- Available in sizes from ½" to 4"
- Available in normal duty set screw lock, normal duty eccentric lock and medium duty set screw lock
- Easy installation and maintenance
- Fully self-aligning
- Wide inner ring for rigidity and more effective set screw locking
- Standard grease fitting for re-lubrication
- Contact seals are standard
- Operating temperatures up to 200° F
- Single piece housings of Class 30 cast iron
- Housings available in the standard painted finish. Powder coating in RAL or custom colors, Stainless Steel Powder coating, Nickel-plating, Epoxy, Teflon and other coatings are available. See page 150 or contact the factory for further information
- Custom machining and design service are available. See page 146 or contact the factory for further information
- Available for sale as complete units, inserts and housings

MOLINE BEARING Cº

MOUNTED BALL BEARING APPLICATION GUIDE

LUBRICATION

The proper lubrication of ball bearing units is critical in order to attain maximum bearing life expectancy. **Moline ball bearing units need to be lubricated prior to use.**

They should be re-lubricated periodically, depending on the environment the bearing is exposed to. The following table can be used as a general guide. Experience will determine the best interval for each specific application.

Lubrication Guide

OPERATING CONDITIONS	BEARING TEMPERATURES	GREASE INTERVAL
Clean	32°F to 120°F	6–12 Months
	120°F to 150°F	1–3 Months
	150°F to 200°F	1–4 Weeks
Dirty	32°F to 150°F	1–4 Weeks
	150°F to 200°F	Daily–1 Week
Moisture	32°F to 200°F	Daily–1 Week

The amount and type of lubricant used will affect bearing life. Lack of lubricant can lead to premature surface fatigue failures of balls and races. Over lubrication can damage seals and result in premature failure from contamination due to the inability of damaged seals to keep foreign material out of the bearing.

When lubricating bearings add grease slowly while the shaft is rotating. When the first sign of grease appears at the seals, the bearing will contain the correct amount of lubricant.

Bearings should not run in steady operation over 200°F and should not exceed 225°F for intermittent operation.

For unusual lubrication requirements or severe duty applications, contact Moline Bearing engineering for recommendations.

MOUNTING INSTRUCTIONS

Proper mounting of ball bearing units is critical to unit performance. Failure to follow accepted mounting practice may result in poor performance and short bearing life.

Good engineering and design practice does not recommend the application of more than two bearings to support any shaft. Where more than two bearings are used to support the same shaft, it is possible to induce heavy bearing overloads. In these cases, extreme care must be taken to line up bearings in both the vertical and horizontal planes. When the recommended two bearings are used, alignment is not as critical. Moline Bearing self-aligning mounted bearing units will compensate for minor differences in mounting structure.

For best results, use turned and ground shafts that are free of rough spots and burrs. If an old shaft is used, mount bearing units on a relatively smooth and unworn section.

Prior to mounting, clean both the shaft and the bearing bore. Coat the shaft with a small amount of oil. Slide the bearing unit on the shaft. Do not hammer the ends of the inner race. If necessary to apply some force in mounting, use a soft metal bar or pipe against the inner race only. Tap the bearing unit into place.

Tighten the two set screws securely to lock the bearing to the shaft. In applications where the bearing is subjected to heavy vibration, shock loads, or heavy thrust loads, then it may be desirable to file the shaft flat or drill the shaft slightly in the area where the set screws will contact.

MAXIMUM SPEED

The maximum speed limits listed for the ball bearings can be found in the load rating table. These numbers should be used as a guide and considered along with other factors affecting bearing operation. Load characteristics, bearing lubrication, and temperature factors all influence bearing operation. It is possible that cataloged speed limits may be exceeded after factory engineers complete a complete application analysis.

MOUNTED BALL BEARING APPLICATION GUIDE

BEARING SELECTION

Selection of the proper Moline bearing unit for a determined speed and load can be made by referring to the load rating tables. Proper selection is made by finding a bearing having the desired bore size which has a load rating equal to or greater than the radial or equivalent radial load required for the application.

The ratings shown in the rating tables are based on an average bearing life of 2500 hours. Average bearing life is approximately 5 times L10 life and is the life which may be expected from 50% or more of a given group of bearings operating under identical load conditions. Life expectancies for other than 2,500 hours average life may be determined by using the rating modification factors listed.

BEARING LOADS

Radial loads and thrust force in combination are the principal load components of bearing applied loads. Moline ball bearing unit ratings are based upon the radial load capacity of the bearing. For applications where bearings are required to absorb thrust loads in addition to normal radial loads, the following considerations must be made concerning the magnitude of the thrust force.

When thrust loads are less than half the radial load, the equivalent load should be considered to be the same as the radial load. If the thrust load is equal to or greater than $\frac{1}{2}$ the radial load, the equivalent load is determined by adding the two loads together. For thrust loads equal to or greater than the radial load, consult the factory.

EXAMPLE 1: RADIAL LOAD SERVICE LIFE

Select a mounted bearing flange block to meet the following application requirements.

- Shaft diameter of 1 inch
- Shaft speed is 1500 RPM
- Radial load requirement is 300 lbs.
- Average life requirement is 5000 hours

From the rating table located on the previous page, locate the series bearing corresponding to a one-inch shaft diameter and follow that line to the 1500 RPM

column. The load capacity in this case is 860 lbs. These published radial load capacities are based on an average life of 2,500 hours and must be modified to suit the application requirement 5,000 hours average life by using the proper multiplier from the chart below. Calculate the equivalent radial load capacity for 5,000 hours average life expectancy as follows:

$$\begin{array}{l} 860 \text{ lbs. radial capacity} \\ \times .794 \text{ 5,000 hours avg. life factor} \\ \hline 683 \text{ lbs. radial capacity} \\ \text{for 5,000 hours avg. life} \end{array}$$

EXAMPLE 2: COMBINATION RADIAL AND THRUST LOAD REQUIREMENT

Select a mounted pillow block to meet the following specifications.

- Shaft diameter of $1\frac{3}{16}$
- A Combination load is applied consisting of
Radial Load of 400 lbs.
Thrust Load is 250 lbs.
- Shaft speed is 1000 RPM
- The average life requirement is 2,500 hours

From the load rating table on the previous page, locate the line with the series bearing corresponding to $1\frac{3}{16}$ inch shaft size and follow this line to the right to the 1000 RPM column. The radial load capacity for the bearing is 1389 lbs.

Since the application average life is what the catalog rating charts are based on there's no need to apply further modification factors.

Because the applied thrust load of 250 lbs. is more than half of the applied radial load of 400 lbs., these loads must be added together to obtain the equivalent load requirement.

$$\begin{array}{l} \text{Equivalent load:} \\ 400 \text{ lbs.} + 250 \text{ lbs.} = 650 \text{ lbs.} \end{array}$$

The equivalent radial requirement of 650 lbs. is less than the rated capacity, so the bearing size desired can be used.

BALL BEARINGS

MOUNTED BALL BEARING INTERCHANGE

Normal Duty Mounted Ball Bearing Interchange - UC and HC 200 Series

MOLINE	DODGE	BROWNING	SEALMASTER	HUB CITY	TIMKEN FAFNIR	FYH
UCP 2-Bolt Pillow Block	SC-1	VPS	RP	PB251	SAS	UCP
HCP 2-Bolt Pillow Block Eccentric	SXR-1	VPE	RPE	PB221	RAS	NAP
UCF 4-Bolt Flange	SC-4	VF4S	RF	FB250	SCJ	UCF
HCF 4-Bolt Flange Eccentric	SXR-4	VF4E	RFE	FB220	RCJ	NANF
UCFL 2-Bolt Flange	SC-2	VF2S	RFT	FB260	SCJT	UCFL
HCFL 2-Bolt Flange Eccentric	SXR-2	VF2E	RFTE	FB230	RCJT	NANFL
UCFC Piloted Flange	FCSC	----	----	----	----	UCFC2
HCFC Piloted Flange Eccentric	----	----	----	----	----	----
UCT Wide Slot Take-Up	WSTUSC	VTWS	RT	WSTU250	----	UCT
HCT Wide Slot Take-Up Eccentric	WSTUSXR	VTWE	RT-E	WSTU220	VTU	NAT

Dimensionally compatible with most mounted ball bearings. However, some dimensional variations may exist.

Please verify your engineering data or contact the factory with any questions you may have.

MOUNTED BALL BEARING INTERCHANGE

Medium Duty Mounted Ball Bearing Interchange - UCX Seires

MOLINE	DODGE	BROWNING	SEALMASTER	IPTCI	FYH	AMI
UCPX 2942 2-Bolt Pillow Block	P2B-SCM	VPS-300	MRP	UCPX	UCPX	UCPX
UCFLX 2940 2-Bolt Flange	F2B-SCM	VF2S-300	----	UCFLX	----	UCFLX
UCFX 2941 4-Bolt Flange	F4B-SCM	VF4S-300	MRF	UCFX	UCFX	UCFX
UCFCX 2943 Piloted Flange	FC-SCM	VFCS-300	MRFC	UCFCX	UCFCX	UCFCX

Dimensionally compatible with most mounted ball bearings. However, some dimensional variations may exist. Please verify your engineering data or contact the factory with any questions you may have.

Modification Factors for Average Service Life and Load Conditions

LOAD CONDITIONS	AVERAGE LIFE (1,000 HOURS)													
	2.5	3	4	5	6	7	8	10	15	20	25	30	40	50
Steady Load	1.00	.941	.855	.794	.747	.709	.679	.630	.550	.500	.464	.437	.397	.368
Light Shock	.900	.847	.770	.715	.672	.639	.611	.567	.495	.450	.418	.393	.357	.331
Moderate Shock	.700	.659	.599	.556	.523	.500	.475	.441	.385	.350	.325	.306	.278	.258

Factors are used to modify for loads that are not steady or for average life requirements beyond the standard 2500 hours shown in the Radial Load Rating table.

NOMENCLATURE

MOUNTED UNIT NOMENCLATURE

Moline Part Number

Bearing Type/Series

- 191** = M2000 Spherical Roller Bearing - Expansion
- 192** = M2000 Spherical Roller Bearing – Non Expansion
- 193** = Type E Tapered Roller Bearing
- 194** = Normal Duty 200 Series Set Screw Locking
- 195** = Normal Duty 200 Series Eccentric Locking
- 196** = M3000 Spherical Roller Bearing with Even-Lok™ – Expansion
- 197** = M3000 Spherical Roller Bearing with Even-Lok™ – Non Expansion
- 291** = ME2000 Spherical E Roller Bearing - Expansion
- 292** = ME2000 Spherical E Roller Bearing - Non Expansion
- 294** = Medium Duty Ball Bearing
- 296** = ME3000 Spherical E Roller Bearing with Even-Lok™ – Expansion
- 297** = ME3000 Spherical E Roller Bearing with Even-Lok™ – Non Expansion
- 393** = Split E1000 Type E Tapered Roller Bearing - Expansion
- 493** = Split E1000 Type E Tapered Roller Bearing - Non Expansion

Housing Type/Style

- 01** = 2-Bolt Flange
- 11** = 4-Bolt Flange
- 21** = 2-Bolt Pillow Block
- 22** = 2-Bolt Split Pillow Block
- 31** = Piloted Flange
- 41** = 4-Bolt Pillow Block
- 42** = 4-Bolt Split Pillow Block
- 51** = Wide Slot Take-Up
- 73** = Split E Cartridge Assembly

Bearing/Shaft Size

- Standard**
- X** = Inches
- XX** = 16th's of an inch
Example: 207 = 2 7/16
- Metric**
- XXX** = mm
Example: 085 = 85mm
- Suffix**
- D** = Double Collar
- E** = Epoxy Finished Housing
- G** = Spring Loaded Garter Seal
- L** = Labyrinth Seal
- N** = Nickel Plated Housing
- SS** = Stainless Steel Coating
- T** = Teflon Coated Housing
- No suffix** = Standard Contact Seal
- Other suffix** = Contact Moline

Example: 19321300 or 193-21-300 = Type E, 2-Bolt Pillow Block, 3" shaft size

NOMENCLATURE

			
2-Bolt Flange 	4-Bolt Flange 	Piloted Flange Cartridge 	Wide Slot Take-Up 

HOUSING IDENTIFICATION

Moline Housing Number

000-00-0000

Housing Type

- 110** = 2-Bolt Flange
- 111** = 4-Bolt Flange
- 112** = 2-Bolt Pillow Block
- 113** = Piloted Flange Cartridge
- 114** = 4-Bolt Pillow Block
- 115** = Wide Slot Take-Up

Bearing Type/Series

- 01** = Type E Tapered Roller Bearing
ME2000 Spherical E Roller Bearing and ME3000 Spherical E Roller Bearing with Even-Lok™
- 21** = M2000 Spherical Roller Bearing and M3000 Spherical Roller Bearing with Even-Lok™
- 31** = 200 Series Normal Duty Ball Bearing
- 32** = Split E 1000 Tapered Roller Bearing
- 42** = 4-Bolt Split Pillow Block
- 61** = UCX Series Medium Duty Ball Bearing

Bearing/Shaft Size

A range of inserts with similar bore can fit in the same housing.
X = Inches
XX = 16th's of an inch
Example: 207 = 2 7/16

Example: 111-01-215 = 4-Bolt Flange - Type E - 2 15/16 (2 and 15)

215 Housing which houses 2 11/16, 2 3/4, 2 15/16, 3, 70mm and 75mm bearing shaft sizes

TERMS AND CONDITIONS OF SALE

PRICES & ACCEPTANCE

All orders are for prompt acceptance only by Moline Bearing Company's (Company) home office in Batavia, Illinois. In the event of an increase or decrease in the Company's prices, the price on any order or contract will be the one in effect at the time of shipment.

TAXES

Any sales, use, consumption or other taxes, customs duties taxes and custom brokerage fees applicable to sale, purchase or use of the products is not included in the price shown on this order and will be paid by the purchaser whenever due.

TERMS

Payment terms are net cash within 30 days from the date of the invoice. Acceptance of all orders is subject to approval of the Company's credit department.

MINIMUM CHARGE

The minimum charge on any order will be \$25.00/U.S. net; parcel post, freight or express charges will be added.

SHIPMENTS

Shipments will be routed to incur the lowest available transportation charges. All premium rate shipping services such as express (air or rail); air freight, etc. will be utilized when requested by the purchaser. The Company will add any additional service charges to the invoice. All shipments, unless otherwise specified, are FOB factory. Claims for shortages, damage or non-delivery in transit will be made by the consignees to the carrier. Request for proof of delivery must be submitted within 90 days from the date of the shipment.

RETURNED GOODS

Goods may be returned within six months of the purchase date, with prior permission and an applicable RGA number. Credits will be issued against the original invoice for future purchases only. A minimum of a 25% restock charge on stock items as well as freight both ways will be deducted from the credit. Goods must be returned in unused, undamaged and "resaleable condition." All credits must be used within six months from the date of issue, or they will be voided.

ORDERS & CANCELLATIONS

All orders are considered firm contracts. If the Company is unable to meet the requested delivery requirements and/or expected shipment dates, the Company will not be liable for any claims for delays beyond the Company's control, nor will the Company accept cancellation or suspension unless mutually agreed upon in writing.

ADDITIONAL CHARGES

Additional charges will be applied to cover the costs of extra packing, special engineering or servicing, or other unusual cost elements such as overtime work authorized by the purchaser which have not been contemplated.

WARRANTY

The Company warrants that products furnished will be free from defects in materials and workmanship under normal use and service for 90 days after delivery of products by the Company.

THE COMPANY'S SOLE OBLIGATION UNDER THIS WARRANTY WILL BE TO REPAIR OR REPLACE ANY DEFECTIVE PRODUCT OR PART WHICH IS RETURNED. TRANSPORTATION WILL BE PREPAID WITHIN THE PERIOD MENTIONED ABOVE WHERE EXAMINATION PROVES TO THE SATISFACTION OF THE COMPANY THAT THE PART OR PRODUCT IS DEFECTIVE.

THIS WARRANTY WILL NOT APPLY TO ANY PRODUCT OR PART WHICH HAS BEEN SUBJECTED TO MISUSE, NEGLIGENCE OR ACCIDENT. THIS WARRANTY, AS SET FORTH ABOVE, IS IN LIEU OF ALL OTHER WARRANTIES EXPRESSED OR IMPLIED, INCLUDING WITHOUT LIMITATION WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

LIMITATION OF LIABILITY

IN NO EVENT SHALL THE COMPANY BE LIABLE FOR ANY LOSS, CLAIM OR DAMAGE CAUSED BY, CONTRIBUTED TO, OR ARISING OUT OF THE ACTS OR OMISSIONS OF PURCHASER OR THIRD PARTIES, WHETHER NEGLIGENT OR OTHERWISE. IN NO EVENT SHALL THE COMPANY'S LIABILITY FOR ANY CAUSE OF ACTION WHATSOEVER EXCEED THE COST OF THE ITEM GIVING RISE TO THE CLAIM, WHETHER BASED IN CONTRACT, WARRANTY, INDEMNITY, OR TORT (INCLUDING NEGLIGENCE AND STRICT LIABILITY). IN NO EVENT SHALL THE COMPANY BE LIABLE FOR ANY INDIRECT, CONSEQUENTIAL, INCIDENTAL OR SPECIAL DAMAGES, INCLUDING, BUT NOT LIMITED TO LOST PROFITS OR OTHER ECONOMIC LOSS.

The terms and conditions of sale stated in this document supersede all others and are subject to change without notice.
